

REMARKS

Claims 1 and 11 have been amended to call for a wiping contact in which it is explained explicitly that the wiping electrical contact with the solder ball is at a point spaced from the vertical center line of the solder ball. Thus, this makes it clearer that the wiping type of advantageous contact is distinguishable from that shown in the reference. In the reference, for example in the upper half of Figure 10, it is clear that the contact hits the solder ball 50 centrally. Similarly, the same thing is seen in the top halves of Figures 5 and 6. Therefore, reconsideration is respectfully requested on the grounds that glancing contact inherent in a non-central contact results in rubbing contact which is advantageous over the jabbing contact suggested in the reference.

Therefore, reconsideration is requested.

Respectfully submitted,

Date: January 24, 2006
